GENESIScoin (GENc) Deployment Proof | SBA Formation 2025

This document serves as a technical proof of the full deployment of the GENc Token Sale infrastructure, conducted in a test environment (BNB Smart Chain Testnet).

The logs, terminal snapshots, and on-chain transactions presented here demonstrate:

- full functionality of the smart contracts,
- activation and synchronization of automated bots (Oracle, DividendTracker, AirdropTracker, B100D, FinalBBot, EligibleBot),
- verified operation of the B100D registration system, DailyPayouts / Final Bonus logic, Dividend Cycle, and Daily Rewards,
- full alignment with the final structure of the SBA System Protocol.

IMPORTANT:
✅ GENc pool values (Presale: 358B, B100D: 30B) are consistent with the final plan and identical to the mainnet version.
⚠️ Parameters such as token price (0.0000001 BNB) and launch timestamp are test values and will be adjusted for final deployment.

📌 The purpose of this document is to provide proof of the logic, bots, and contracts working together to fully automate the tokenization process of GENc under the SQUNOHOLIX BRAND ASSOCIATION.

SYSTEM BOOT | Pre-Sale INIT

GENc Pool Configuration & Initial System State

These two screenshots document the exact moment of GENc Pre-Sale initialization and internal system sync:

– Pools initialized:
- preSalePool: 358,000,000,000 GENc
- b100dPool: 30,000,000,000 GENc
- publicSaleBonusPool: 30B
- airdropPool: 10B, dividendPool: 100B

– PreSaleGENc contract returns:
- Stage: 1,
- Token price: 0.0000001 BNB,
- Bonus: 4%,
- Available tokens: 104,000,000,000

(All values returned as BigNumber format.)

On the terminal side (PM2), bots are initialized — oraB, airT, divT are launched and waiting for logic triggers before live operation.

🧠 The bot system automatically:
– updates live BNB price from the oracle,
– checks GENc amount required vs. held (Required vs Has),
– identifies new token holders,
– updates token pool state,
– validates address eligibility.

This is where GENc actually comes to life.
Not just code in a repo — but a fully autonomous tokenization engine.

```
root@DESKTOP-CQT9UQR: ~/genc-project

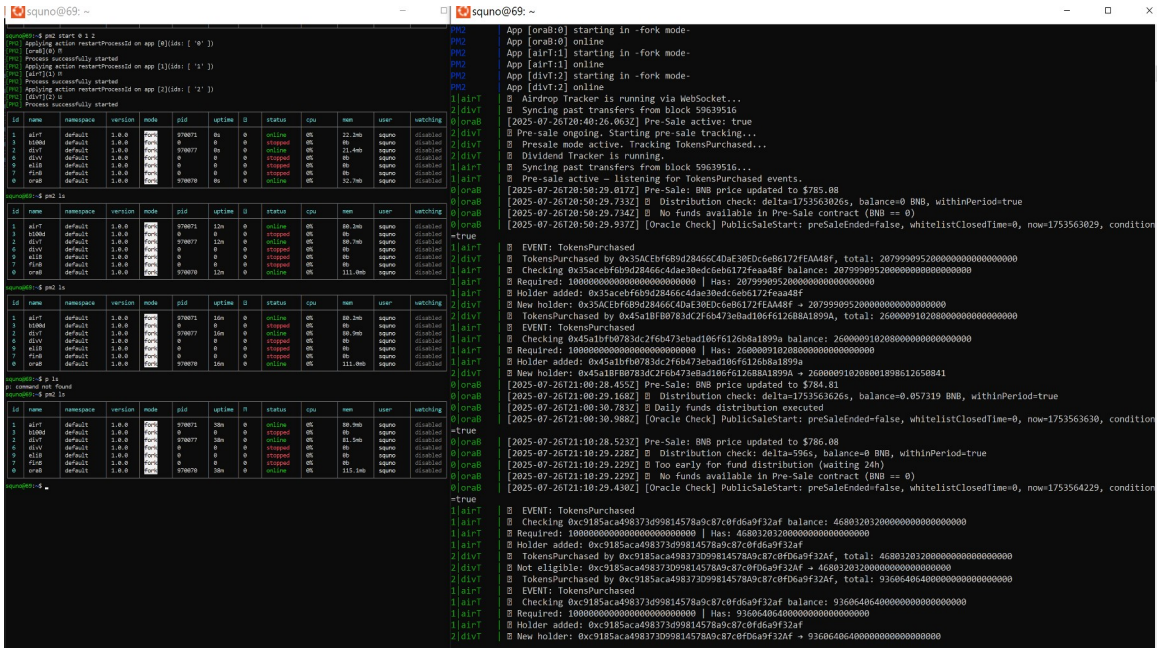
```



B100D FULL CYCLE – STRUCTURE, EVENTS, VERIFICATION

🔒 WhitelistOpened – Start of B100D Registration
– Users register via the registerForB100D() function
– B100DRegistered event emits their address and initialHold (GENc balance at time of registration)
– The b100d bot listens to events and builds a local monitoring list
– The contract stores initialHold in its on-chain B100D participants mapping

📌 That initialHold becomes the key to the future Final Bonus payout.

🔒 WhitelistClosed – End of Registration
– WhitelistClosed(timestamp) event is emitted
– From this moment, the system enters verification mode
– The b100d bot becomes a watchdog and starts monitoring GENc balances of all registered addresses

If any address drops below its initialHold, the bot calls ejectFromWhitelist() and removes it from the contract's on-chain list.

⚙️ triggerB100DStart() – B100D Activation via Oracle
– Can only be triggered by the Oracle
– Condition: 24 hours must pass after WhitelistClosed
– Once triggered, the following are set:

b100dStarted = true
b100dStartTime = block.timestamp
b100dCurrentDay = 1
From here, the system enters daily payout mode.

🔁 distributeB100DDay() – The 100-Day Payout Cycle
– Oracle calls distributeB100DDay() once per day
– The contract pays out proportionally from the B100D pool to eligible addresses
– The b100d bot keeps monitoring holdings in real time
– If anyone drops below their initialHold → eject()

✅ Only loyal, fully qualified addresses receive payouts.

🎯 FinalBonusStarted() – The 100-Day Conclusion
– The system takes a snapshot of all surviving addresses
– totalInitialHold is calculated based on their original registration holdings
– The Final Bonus pool is distributed proportionally

🧠 This snapshot ignores current balances.
What matters is what you held when you registered — and whether you stayed in the game.

📦 FinalBonusBatchProcessed() + FinalBonusCompleted()
– Bonus is distributed in batches
– Each batch includes a from → to range of addresses
– When all batches are processed, the contract emits FinalBonusCompleted()
– The entire process is verifiable on BscScan (TestNet)

📜 Proofs:
– Terminal logs from finB, oraB, b100d
– Contract events (WhitelistClosed, B100DRegistered, FinalBonusStarted, ...)
– On-chain TX hashes
– Explorer views of GENc token movement

🧠 B100D is not a feature.
It's an intelligent, autonomous payout and verification mechanism based on trustless logic.

Segment: eliB + divV — LIVE CYCLE & BONUS SNAPSHOT

🎬 Cycle 12: Distribution in Motion
✅ Status: Cycle 12 completed – payouts started

Batch Details:
Batch 1 → 3 users
Batch 2 → 3 users
Batch 3 → 2 users

Proof of Execution:
Terminal divV log confirms all payouts with exact address → amount mappings in GENc
BscScan (left pane) shows confirmed Transfer events in real-time from the contract

6|divV | Batch 1.015 sent (3 users)
6|divV | Batch 1.03 sent (2 users)
6|divV | Cycle #12 completed - creating new snapshot
6|divV | Creating snapshot…
6|divV | Snapshot for cycle #13 - 8 users qualified
6|divV | Monitoring cycle 13
9|eliB | Daily reset → day 145, phase 2, sent 0/75

🧠 Each payout strictly follows eligibility from prior snapshots and user holding validation.

🔄 Live eliB State + Terminal Reset
✅ eliB Status:
Phase 2 | Day 144
Bonuses sent: 4 / 75
Daily reset active: 599 seconds until next cycle

Logs Confirm:
Bonuses are distributed per valid LP buys
Real-time holding checks ensure compliance before payout
No manual input required — logic fully automated

📡 Both divV and eliB bots update in sync with smart contract data every cycle reset.

📸 Cycle 13: Snapshot & Monitoring
🟢 Cycle 13 started:
8 users qualified
Snapshot created — terminal shows updated balance (divT) and payout cycle flow

Monitoring Active:
Terminal divV logs show live tracking of holding thresholds
Auto-eject enabled: any drop below initialHold → instant removal

🛡️ Snapshot = trustless, timestamped, immutable basis for upcoming payouts.

🔢 Contract Confirmations (from await calls):
getCurrentDay() → 144
publicSaleBonusPoolGENc() → 29.9B
airdropPoolGENc() → 10B
dividendPoolGENc() → 88.04B

📦 All pool balances aligned with design specs.
🧮 GENc state machine ticking forward — no fallback, no overrides.

📌 Summary:
This section confirms:
Proper execution and validation of Cycle 12 payouts
Autonomous transition to Cycle 13 with verified snapshots
Phase-accurate eliB activity with enforced bonus caps
Full on-chain alignment of pools, cycles, and bot logic

💡 Conclusion:
The system is live.
It self-resets, self-validates, self-distributes.
No human switch. No backdoor.

GENc isn't just deployed.
GENc is alive.

This isn't a project where "a dev will handle it."
This is autonomy — bots, contracts, timed logic, no fallback.

We're not here to make decisions.
The code decides.

💥 And this is the fucking definition of autonomy.
Written once.
Executed forever.

GENcoin – Welcome in ASSOCIATION.
