“If you found this line — you’ve entered the Digital LAB.”

— DL. SYSROOT LOG 001 “GENcoin DL. SBA Formation, 2025”

GENESIScoin — Whitepaper

Introduction – Why GENc Exists

GENc isn't just another meme coin promising a moonshot.

It's a utility token with a systemic purpose — built from scratch to address a real market flaw: the absence of a fair, automated, and lasting system for rewarding loyal investors.

In a space where most projects burn out within seventy-two hours of hype, GENc flips the script:

– It builds tension, not panic.

– It rewards patience, not randomness.

– It punishes opportunism, and celebrates holding.

This isn't a place for fast-clicking gamblers. This is a system for consistent holders.

Why are we doing this?

Because we've had enough.

Enough of watching projects that:

promise dividends, yet write nothing in code,

throw bonuses at random buyers instead of real supporters,

treat the token like a temporary cash grab mechanism,

and then… leave the community with nothing.

GENc is the answer.

A systemic, auditable, and fully autonomous distribution mechanism for:

– daily bonuses,

– BNB dividends,

– GENc dividends,

– a 100-day loyalty pool,

– a dynamic final bonus,

– and a range of actions that happen without asking — solely based on user behavior.

GENc = GENESIScoin

The first token of a new generation within the SBA (Squnoholix Brand Association) ecosystem.

Not a product. Not a trend. A system.

Engineered as a trial by fire for the entire upcoming SBA Authentic™ token architecture.

No obsession with launching — the focus is on sustainability.

No dumping post-presale — instead: vesting, locks, distribution and manipulation detection systems.

Where did this idea come from?

From observation.

From analyzing over three hundred projects that:

vanished after their presale,

never paid a single cent,

or were run manually and chaotically.

We did it differently:

GENc runs fully autonomously — from start to finish.

All payouts, bonuses, dividends, monitoring and enforcement are executed by decentralized Oracle bots — leaving no room for "oops", "it failed", or "admin's asleep".

What's next?

This is just the beginning.

GENc doesn't need an admin. It only needs users who understand one thing:

loyalty is the system's foundation.

Each quarter ends with an automatic on-chain report.

No narrative. Just data.

Over time, new tokens and new layers will emerge.

But GENc is the first chapter.

The ignition point.

A trial by fire. A stress test for everything that follows.

And most of all — a declaration:

We're not here to play games.

We're here to deploy systems that can't be ignored.

No memes. No mascots. No shortcuts.

Just code, conviction, and the will to outlast.

GENc Tokenomics – Trust Engineered Through Logic

GENc has a total supply of one trillion tokens (1,000,000,000,000 GENc), with a structure crafted with surgical precision.

Each allocation percentage serves a specific function within the system and is subject to defined release or lock-up conditions.

GENc isn't about "wild distribution."

It's a deliberately designed value flow — balancing community rewards, liquidity security, and strategic reserves.

In short:

– 33% for Pre-Sale — across five structured sales stages

– 10% Liquidity Pool — with 50% permanently locked and 50% managed via the Asset Manager

– 5% Airdrop — community-driven, distributed through SBA campaigns

– 5% Marketing — campaigns, PR, and strategic actions

– 6.2% Future Project — 32B for GENc expansions, 30B to SBA Treasury

– 5% TeamG — with vesting schedule (6-month cliff + quarterly unlocks)

– 1% DevG — reserved for developers and technical support

– 10% LP Backup — fully locked for future DEX liquidity deployments

– 3% Event Expo Holders — released in 10B tranches every 12 months

– 2.8% Pre-Sale Bonus — for first-wave transaction participants

– 3% 100-Days Bonus — loyalty program rewarding long-term holders

– 3% Public-Sale Bonus — daily rewards for active buyers

– 10% Dividend GENc — for automated distribution to eligible holders

– 3% Project Partners — strategic allocation to trusted entities

Pre-Sale Fund Flow – Automation and Transparency

Funds raised during the Pre-Sale don't sit idle. They work — daily.

The smart contract automatically distributes BNB proceeds from token sales every 24 hours to a set of wallets, according to a predefined schedule.

All transactions are on-chain and fully public — anyone can verify the hashes.

50% of all Pre-Sale funds go directly into the Liquidity Pool.

That's hardcoded.

Every 100,000 USDT raised triggers the creation or reinforcement of LP — paired at a fixed ratio: 100,000 BNB + 1 billion GENc.

These actions are announced as LP Events (up to 5x per Pre-Sale stage).

If all five Pre-Sale stages are sold out, the projected initial LP depth is:

45 billion GENc + 4.5 million USDT.

This is the opening strike — not the full deployment.

The remaining 55 billion GENc allocated for liquidity will be systematically added to the pool over time.

Each injection follows defined milestones and ecosystem triggers — ensuring that liquidity grows in sync with project progression, not speculation.

The remaining BNB funds collected during Pre-Sale aren't idle — they're deployed strategically:

– team expansion and reinforcement

– infrastructure, legal, and operational execution

– Asset Manager development

– and rolling out the next phases of the ecosystem

This distribution logic reflects the strategic foundation of what we're building — a system designed for scale and permanence.

Because GENc isn't a pitch. It's the first functional unit of SBA infrastructure — and the beginning of a real-world collective taking physical form.

On-Chain Fund Execution

This is where logic meets capital.

To enforce that vision, the distribution of Pre-Sale funds is hardcoded — not as a suggestion, but as executable on-chain truth.

Each day, the smart contract executes a predefined split of all collected BNB into operational wallets, each mapped to a critical SBA function.

No treasury committee. No approvals. No "we'll decide later."

Just deterministic execution. Every 24 hours.

The allocation breakdown is publicly visible, verifiable, and immutable:

– 50% to Liquidity Pool pairing and depth scaling

– 10% to TeamG — operations, logistics, and expansion

– 10% to DevG — ongoing smart contract and infrastructure development

– 7% to SecureAudit — auditing, compliance, and security verification

– 7% to LevelUp Vision — strategic design and long-term planning

– 6% to Marketing — campaign rollout and narrative architecture

– 5% to Community — airdrops, engagement, and activation

– 5% to Project Expansion — ecosystem growth, partners, and modules

These aren't placeholders.

These are live rails — distributing real capital, powering real systems.

This isn't just strategy on paper.

This is capital choreography — hardcoded in Solidity.

GENc isn't guided by opinions or trends.

It's written by code.

Automated. Structured. Executed without hesitation.

GENESIScoin.

Not imagined — engineered. Inside the SBA Digital Warehouse.

GENc Pre-Sale Mechanics

Stages, pricing, and token supply

The GENc Pre-Sale is designed as a progressive stage-based system with a clearly defined token allocation, increasing price, and dynamic bonus logic.

Each stage is an independent event with its own supply, time limit, and closing conditions.

Stage	Tokens Available	Price (USD)	Bonus (%)	Duration
1	100B + 4%	0.00001	4%	No limit
2	60B + 8%	0.00002	8%	50 days
3	60B + 9%	0.00003	9%	50 days
4	60B + 10%	0.00004	10%	50 days
5	50B + 15%	0.00005	15%	No limit

Total Pre-Sale supply: 330 billion GENc + bonuses

🔄 Purchase Process:

The user sends BNB to the contract (buyTokens())

The contract converts BNB to USD based on Oracle price

GENc amount is calculated based on stage price

Bonus is added (according to current stage)

Tokens (purchase + bonus) are sent immediately to the buyer

All balances and pool states are updated on-chain

🛡️ Limits, Security & Conditions

Minimum purchase: 50,000 GENc

Maximum per transaction: 5,000,000,000 GENc

Maximum user balance during Pre-Sale: 10,000,000,000 GENc

The holding cap can be increased through community governance in later stages

Pre-Sale pool operates independently from the LP

Funds and tokens are secured, fully auditable

Stages close automatically when the pool drops below 40k GENc, or manually by the owner if below 50k

Tokens are only assigned if the contract holds enough balance (including bonuses)

Trading is disabled until the Pre-Sale ends — preventing early dumps

🔍 Transparency & Auditability

Every purchase, allocation, and stage closure is logged on-chain (TokensPurchased, StageClosed, StageTimeout)

All data is available for public verification at any time (via transaction hash)

The system runs fully autonomously — no manual intervention needed for bonuses or allocation

3.1 Bonus System

Pre-Sale, Public Sale, and Rollover

The GENc bonus system rewards loyalty, timing, and participation.

It is progressive, structured into phases that vary in bonus value and daily allocation limits.

🔹 1. Pre-Sale Bonuses (Instant Bonus)

Each Pre-Sale purchase includes an instant bonus, based on the stage:

Stage	Bonus
1	+4%
2	+8%
3	+9%
4	+10%
5	+15%

The bonus is delivered instantly in the same transaction — no delays, no claiming.

Users only need to meet the minimum purchase requirements.

🔷 2. Public Sale Bonuses (Daily Bonus System)

Once the Pre-Sale ends, the Public Sale Bonus activates — daily rewards for buying GEN from the open market (LP on PancakeSwap).

🔧 Parameters:

– Instant payout, one bonus per address per day

– Verified by autonomous bot (listens to LP transactions)

– Daily pools are limited — first come, first served

Bonus Structure (optimized for 30B GENc):

Phase	Days	Min Purchase	Bonus / tx	Daily Limit	Total Pool
1	1–100	2M GENc	1M GENc	100 addresses	10B
2	101–200	3M GENc	1.3M GENc	75 addresses	9.75B
3	201–300	5M GENc	2M GENc	50 addresses	10B
4	301+	7M GENc	3M GENc	25 addresses*	0.25B + rollover

The GENc Bonus System concludes with Phase 4 — the Rollover Phase, where remaining unclaimed bonuses from previous days are redistributed to eligible buyers.

🔄 How Rollover Works

At the end of Phase 3 (Day 300), any unclaimed daily bonus allocations are rolled over into a final reward pool. This pool continues to operate under stricter rules:

Parameter	Value
Min Purchase	7,000,000 GENc
Bonus per Buyer	3,000,000 GENc
Max Buyers/Day	25 addresses
Duration	Until the rollover pool is empty

The rollover pool starts with a minimum of 250 million GENc — enough for at least 3 full days of activity (3M × 25 × 3 = 225M), with any extra carried over until fully distributed.

Eligibility is determined in real time by the autonomous BonusBot, which listens to LP purchases and validates conditions on-chain. Only one reward per address per day is allowed.

💡 Example

If 1.2 billion GENc worth of daily bonuses remain unclaimed after 300 days:

Phase 4 will support up to:

floor(1,200,000,000 / 3,000,000) = 400 winners,

spread across 16 bonus days (25 winners/day).

This final phase ensures the system rewards those who stay active and consistent.

3.3 Security, Auditability & System Integrity

Security and transparency are foundational to GENc's mechanics. The entire bonus logic — from

Pre-Sale stages to Public Sale to Rollover — is:

Hard-coded in Solidity, publicly auditable

Enforced by autonomous bots with no central intervention

Backed by on-chain logs (events like TokensPurchased, PublicBonusAwarded, RolloverExhausted)

Immune to manipulation: only on-chain LP purchases are eligible

All thresholds, stage closures, caps, and bonus logic are independently verifiable via transaction hashes and block data.

🧠 Final Thought: It's Not a Promise — It's a Protocol

GENc doesn't reward hype or speculation — it rewards discipline.

The system doesn't ask for your trust — it proves itself block by block.

There are no shortcuts here. The maximum benefit comes not from chasing daily bonuses,

but from entering early and staying the course for 300 days.

📌 At best, a participant can accumulate 430 million GENc by buying only the minimum required each day.

Anything beyond that? Depends on you — and how you play the game.

This is not just tokenomics.

This is capital choreography — automated by code, verified by the chain.

B100D — 100-Day Loyalty Program (Bonus100Day's)

B100D is a unique loyalty program designed exclusively for GENESIScoin Pre-Sale participants, rewarding those who hold their tokens consistently for 100 consecutive days.

The entire system runs fully autonomously — with no admin intervention — managed entirely by a dedicated bot: b100dBot.

🟡*Participation & Registration*

Minimum initial holding: 150,000,000 GENc

Participant limit: 2,000 whitelist spots

Registration fee: 0.1 BNB (one-time, non-refundable)

Registration available only during Pre-Sale Stage 5 — via the registerToB100D() function

Access management: fully handled by b100dBot

The initialHold is recorded at the moment of registration and acts as a benchmark for verification and bonus calculation.

The address must maintain this holding level for the full 100 days — otherwise, it is disqualified.

🟢 *Daily Bonus — Fixed Distribution*

Duration: 100 consecutive days (no breaks)

Daily payout: 150,000 GENc per eligible user

Total guaranteed payout: 15,000,000 GENc per user

Payouts are guaranteed as long as the initialHold is maintained

The daily pool is funded by b100dPoolGENc

🔴 *Disqualification & Redistribution*

If the user drops below their initialHold even once, they are immediately removed from the whitelist.

They permanently lose:

– All future daily payouts

– The right to participate in the Final Bonus

Their unpaid bonuses stay in the B100D pool.

There is no return — eject is permanent, no reinstatement.

🏁 *Final Bonus — Endgame Reward*

After 100 days, the Oracle bot triggers the function triggerFinalBonusDistribution(from, to).

A Final Bonus Pool is created from all unused slots and unclaimed GENc.

Every unused spot = 15,000,000 GENc

Example: if only 800 out of 2,000 spots were filled, then 1,200 × 15M = 18B GENc flows into the Final Bonus Pool.

This final pool is distributed proportionally among users who:

– completed all 100 days without eject

– maintained their initialHold throughout

The higher your initialHold at registration, the bigger your share in the Final Bonus.

🧠 Strategic Gain

Guaranteed return from daily payouts: ~10% ROI (in GENc)

Final Bonus depends on:

– total number of registered users

– number of disqualified addresses

– your initialHold size

Total ROI can exceed more than 20% — no staking, no delegation required.

◆ GENc Dividends — Combo System & Automated Payouts

GENc Dividends is an advanced profit distribution system designed for loyal token holders.

Instead of staking or locking funds, all you need to do is hold your tokens and stay patient.

The system is fully autonomous and uses snapshots, a progressive combo mechanism, and cyclical payouts.

🟩 *Participation & Eligibility*

You qualify for the dividend program if you:

– Purchased GENc during Pre-Sale or on the market (e.g. PancakeSwap)

– Hold at least 50,000,000 GENc

– Maintain your balance throughout the active cycle

– Have not been disqualified (Eject)

Addresses are added automatically by the monitoring system — no manual registration is needed.

📸*Initial Hold & Snapshots*

At the moment of first qualification, the system assigns the address an Initial Hold — the amount held at entry.

In future cycles, the address is verified against this value.

Simple rules:

– Maintain or increase your holding → you stay eligible for payouts

– Drop below your Initial Hold → system ejects you from the program

🔁*Combo – Progressive Reward System*

Each completed cycle where the address maintains its Initial Hold increases its Combo level — which boosts the payout percentage.

Cycle	Payout	Combo (%)
1–2	✅	2%
3–4	✅	3%
5–6	✅	4%
…	✅	…
Max	✅	10%

Combo increases every two cycles.

The max payout is 10% of Initial Hold per cycle.

All of it is fully automated — no staking, no claiming.

⛔*Eject & HoldProof*

If your balance drops below Initial Hold, the system will:

– instantly eject you from the current cycle

– reset your Combo to zero

– block payout

– initiate HoldProof Mode — one full cycle where you must maintain your balance without receiving any payout

Only after successfully completing HoldProof, the address returns to the dividend program.

📈 *Initial Hold Update*

If your balance increases by at least 51% above your current Initial Hold, the system will:

– automatically update the threshold

– not reset your Combo

– treat it as a sign of stronger investor behavior

🔄 *Payout Cycles*

The system operates in cycles of 21 to 28 days. Each cycle includes:

– A snapshot of eligible addresses

– Real-time monitoring of holdings

– Conditions check

– Dividend payouts from dividendPoolGENc

After each cycle, a complete report is generated — on-chain and off-chain (JSON logs) — listing all payouts.

📊 *Transparency & Automation*

– All snapshots, combo states, ejects, and payouts are logged

– Payouts are executed by an auditable contract function

– The system runs 24/7, fully autonomous

– Users can check their status, combo, and payout history at any time

💡 **Outcome**

GENc Dividends isn't a promise — it's a mechanism based on on-chain data and automated execution.

No staking. No clicking.

Hold = Earn.

System assumptions:

– Each cycle = 21–28 days (avg. 24.5 days)

– Combo increases every 2 cycles

– Max combo: 10% of Initial Hold (achieved after 18+ cycles ≈ 1 year)

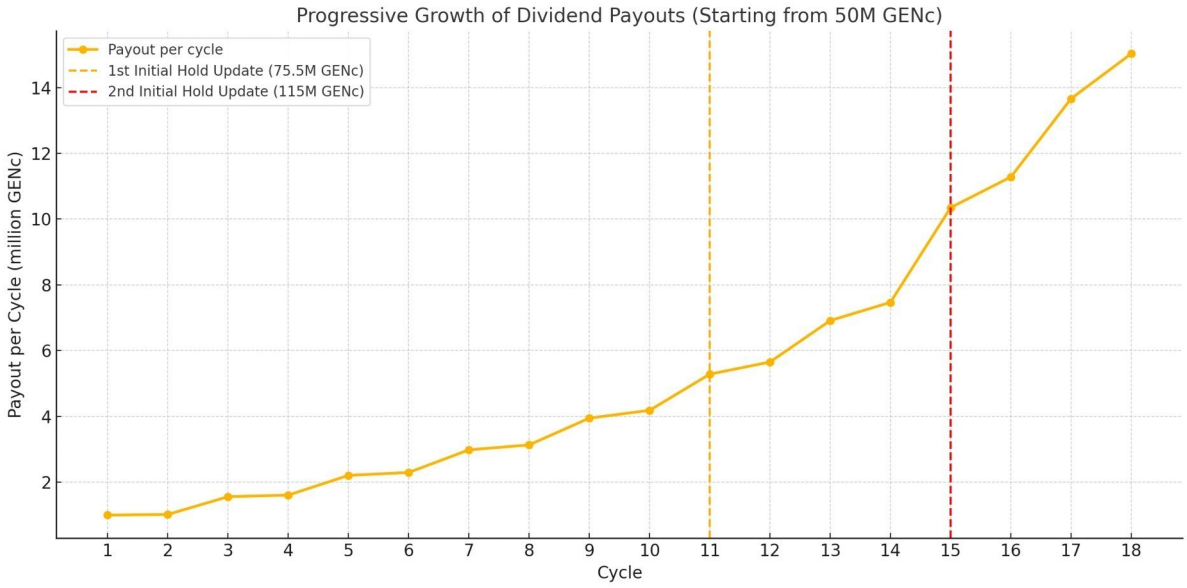
– Payouts are based on Initial Hold, not current balance

If a user holds tokens for a full year with no eject, their total ROI could look like this:

🟢 *ROI Scenarios*

Scenario	Description	Annual ROI (GENc)
⚠️ Interrupted Holding	Eject mid-year, returns after HoldProof	~30–50%
🔄 Continuous Holding	No eject, full-year combo	~100–118%
📈 Increased Holding	Combo + Initial Hold update during cycles	120%+

📎 Conclusion



This system promotes stable holding, progress, and engagement.

The longer and smarter you hold, the larger your actual share in the dividend pool.

◆ BNB Dividends — On-Chain Passive Income for GEN Holders

GENc is not just a token — it’s an asset that generates real returns.

Every GENc holder qualifies for automated BNB dividend payouts via a proven mechanism based on DividendPayingToken, powered by transaction fees (TAX) and swaps.

🛠️ *How It Works*

– Every transaction (buy/sell/transfer of GENc) applies a TAX fee

– Collected BNB funds are stored in the GENc contract

– Once a threshold is reached, the system triggers an automatic swap and BNB distribution

– Funds are distributed proportionally based on the number of GENc tokens held

🎁 *Eligibility Criteria*

Requirement	Value
✅ Minimum holding	100,000,000 GENc
⏱️ Claim wait time	(as configured)
🔁 Payout process	Automatic (process())
📜 Payout record	DividendWithdrawn event

No staking. No clicking.

Just hold GENcoin — and the system pays you automatically.

🔄 *Source of Dividends*

– Dividends come exclusively from real transaction fees

– The system runs 24/7, fully on-chain, and publicly auditable

– No tokens are minted — everything comes from volume

🧠 *Why It Matters*

This isn’t a "future yield promise."

It’s an automated, passive distribution system tied to actual trading volume and real economic activity of the GENcoin.

GENESIScoin – Pre-Sale Airdrop Mechanism

The airdrop system during the pre-sale follows a progressive model tied to the sales progress across 5 stages. The maximum airdrop pool is 15 billion GENc.

🔢 Stages & Conditions:

Stage 1 – No requirements

→ Unlocks 1B GENc after completion

Stage 2 – Requires 50% of tokens sold

→ If met: unlocks 2B GENc

→ If not: entire 2B is split 50/50 (Burn / Dividend)

Stage 3 – Requires 50% of tokens sold

→ If met: unlocks 3B GENc

→ If not: goes to Burn / Dividend

Stage 4 – Requires 50% of tokens sold

→ If met: unlocks 4B GENc

→ If not: goes to Burn / Dividend

Stage 5 – No requirements

→ Unlocks 5B GENc after completion

📉 Minimum Guaranteed Pool:

6 billion GENc – guaranteed regardless of sale outcome

15 billion GENc – if all conditions are met

🔥 What happens to unallocated tokens?

If conditions aren't met for a given stage:

50% goes to Dividend Wallet – to fuel future passive income

50% goes to Burn Wallet – to be burned in a strategic marketing/market-impact event

Note: Burn Events are announced in advance, with specified amount and date.

2 Milestone Holders Airdrop – 10B GENc

Purpose: To incentivize the growth of the GENc holder base.

🧩 Milestones:

500 holders → 500M unlocked

1K holders → 1B

1.5K holders → 1.5B

2K holders → 2B

5K holders → 5B

➡️ Upon each milestone: automatic unlock + scheduled snapshot for distribution.

3 Quest & DAO Rewards – 5B GENc

Purpose: Activate the community via DAO actions and on-chain quests.

Participation in snapshots, DAO votes, on-platform actions

Reputation and achievement system

Tokens distributed proportionally to user engagement and reputation

4Utility & Social Campaigns – 20B GENc

Goal: GENc brand expansion through community-driven campaigns.

Twitter, Discord, Telegram, Reddit, YouTube, TikTok

Point system, leaderboards, viral quests

Automated rewards for social activity

Possible influencer and partner integrations

Global Airdrop Rules

Managed via snapshot logic and smart contracts

Unused Pre-Sale airdrop tokens: 50% Burn / 50% Dividend

Full transparency: all actions logged on-chain

DAO has governance influence over parts of the process (e.g. Social Utility distribution)

Airdrop Console

Purpose: Terminal-based tool for manual GENc airdrop execution from unlocked pools.

Modes of Distribution:

Proportional Airdrop – Based on each qualifying user's token balance

Fixed Amount Airdrop – Equal amount to each qualifying address

Operational Flow:

Console reads addresses from trackedHolders.json (generated by Airdrop Tracker Bot)

Each address must hold ≥ 1,000,000 GENc

Operator sets the required minimum holding (announced publicly before each drop)

Balances are fetched live from the token contract

Distribution is done in batches of 200 using the airdropByList(...) function from PUBLIC_SALE_ADDRESS

Logging & Security:

Transactions are logged to airdropLog.json with batch IDs and hashes

System operates locally with private key access — no browser or frontend needed

Operator controls mode, threshold, and execution

Use Cases:

Manual distribution after Pre-Sale stages, milestone unlocks, DAO votes, or promotional events

🛡️ **Security & Transparency**

GENc was created with one thing in mind — trust.

That's why everything essential is written into smart contracts — public and verifiable.

The token code was built upon proven and audited security standards, and deployed with full compatibility with BNB Chain infrastructure.

🔒 The GEN token is based on a structure that underwent an independent audit —

with no critical vulnerabilities and full BEP-20 compliance.

🔍 Details? It's all on-chain — transparent, immutable, and open for verification.

📜 Audit & Visibility of Key Components

During the Pre-Sale, full audits are planned for:

– the Pre-Sale contract

– the Public-Sale module

– the BNB payout system (DividendBNB)

– the automation layer (Oracle, Verifier, Tracker)

Even though part of the logic operates off-chain, every action ends with an on-chain transaction that can be verified.

This is a chain of proof — not marketing.

It's written in the code, visible in the explorer — immutable and untouchable.

📊 Transparency — More Than Just a Word

– Daily distribution of Pre-Sale funds

– Snapshots, ejections, payouts — all on-chain

– Bot activity logs — available off-chain

– The system runs in real time, 24/7

Every three months, a comprehensive quarterly report will be published:

– a summary of system operations

– current fund and liquidity status

– detailed records of dividend and bonus payouts

– smart contract activity

– roadmap and next-quarter planning

The report will be publicly available and accessible —

for investors, auditors, and anyone who wants to look under the hood of the project.

📄 Summary

GENc isn't just technology.

It's a system that accounts for every action.

Instead of asking "Can I trust this?", just look at the data.

Security? Done.

Transparency? At every level.

ROADMAP: The Path Is Not Predicted. It's Engineered.

We don't predict the future. We design it.

This is not another roadmap full of fancy diagrams. These are concrete milestones that lead us — and you — through the evolution of GENc and the SBA structure.

Each checkpoint is verifiable. Publicly. On-chain.

🔹 Q4 2024 – The First Step

Squnoholix.com is born — the launchpad for the entire ecosystem.

It marks the beginning of a vision: merging brand, community, and Web3 tools into one cohesive system.

🔹 Q1–Q2 2025 – The Foundation

GENc exists on mainnet, awaiting activation.

We develop the Pre-Sale and Public Sale contracts.

We're building the automatic distribution system for funds: liquidity, bonuses, and dividends.

In the background — the early architecture of SBA and the first outlines of the project verification framework.

Preparations for launch are in full swing:

– Finalizing reward mechanics

– Load testing

– Bot refinement

– External validations

GENc is not entering Web3 half-baked.

🔹 Q3–Q4 2025 – PRESALE LIVE & Infrastructure Expansion

The Pre-Sale goes live — five stages with clear limits and reward logic.

Each stage has its own mechanics. Stages 1 and 5 are full sell-outs. Stages 2–4 are time-based, not hype-driven.

And that's not all:

– External audits begin (Pre-Sale, Public Sale, Dividend system, AssetsManager)

– We expand the technical and operations team

– Infrastructure is fortified — we're becoming real

– Entity formation and registration of operations

– Launch of LP Loaded events — public liquidity creation announcements

– SBA evolves from a concept into a structured organization

🔹 Q1–Q2 2026 – Public Phase Begins

The public sale kicks off. From now on, anyone can join.

We launch:

– Anti-Dump Control (DMC)

– GENc & BNB dividends

– The 100-day program B100D

– The Public Sale Bonus system

– Full automation of payouts and on-chain actions

Everything runs autonomously. No manual triggers.

GENc functions like clockwork — autonomously, fairly, transparently.

Behind the scenes — the first tests of non-token products (including AI Never Get Tired).

The SBA structure is now functional. Early-stage partnerships and verification models emerge.

🔹 Q3–Q4 2026 – Stability & Direction

GENc is operational. Bonuses, dividends, and payouts are running.

The user base is growing. The token has ongoing utility.

The team focuses on what's next:

– Expanding ecosystem tools

– Beginning development of the project verification protocol

– Early Treasury structures and partner registry

– Trust infrastructure (SBA Authentic) — taking shape

🧭 Summary

This isn't a wishful thinking roadmap.

It's an action plan — with trackable stages and on-chain evidence.

Further steps — 2027 and beyond — depend on the pace of expansion, adoption, and SBA development.

We say what we do. We do what we say. And everything can be verified later.

Because this isn't just a roadmap.

It's a declaration of direction.

🏛 **SBA & the GENc Ecosystem**

GENc isn't just another token — it's the ignition point for something far greater.

A system's being formed. Quietly. Purposefully.

And GENESIScoin is the first spark.

Already during Pre-Sale, a specific allocation — 3% of supply (31B GENc) — is reserved.

Not for hype.

Not for burn.

But for the foundation of something structural — something operational.

We're not launching a foundation.

We're building infrastructure.

A backbone for what comes next.

🛠 What we can tell you:

– Allocation exists. It's on-chain.

– Funds are distributed autonomously.

– Transparency is non-negotiable.

– It's not for show — it's for function.

– Auditable. Measurable. Already moving.

🌐 And something called SBA Authentic…

You'll hear more about it soon.

Some say it might change Web3 rewrite the rules.

We're not confirming anything.

But we are watching.

This isn't a whitepaper promise.

This is infrastructure in motion.

We’re not asking you to believe.

We’re showing you what's possible.

And if you think GENESIScoin is the main event —

you haven’t seen what it’s connected to.

DL. – Digital LAB

It didn’t launch. It emerged.

No flashy launch. No countdowns.

DL. isn’t an idea — it’s the code already running.

It exists wherever the Association stores logic, records data, or deploys truth.

Right here, right now — this is DL.

This is the first terminal.

And this… is just the beginning.

FINALCHAPTER: GENESIScoin Protocol Core The Non-Mintable Modular Engine

This is not the end. This is the engineered beginning.

SQUNOHOLIX BRAND ASSOCIATION, 2025

I. Modular Origin Why GENcoin Had to Be First

GENESIScoin (GENc) was not born out of hype. It was architected as the first irreducible element of a much larger autonomous organism the SBA (SQUNOHOLIX BRAND ASSOCIATION) formation. Before pre-sale, before interfaces, before logos there was a need for one thing: a Finance Core that could resist compromise, adapt to change, and outlive cycles.

And so GEN was built not to shine immediately, but to last.

II. Immutable by Supply Non-Mintable by Design

From day one, GENc supply is: Fixed Total Supply Strictly Non-Mintable

No hidden mint functions

No owner-mint access

No token inflation possible

The _mint() function is absent.

GENcoin is anti-inflationary by contract. There will never be more GENc.

III. The Tax Engine Locked In, Then Voted Forward

GENs tax system was developed for fairness and sustainability across all types of transfers:

Category	BUY	SELL	TRANSFER
Auto-Burn	1%	1%	1%
Liquidity	1%	4%	0%
Development	1%	1%	0%
Marketing	1%	1%	0%
TeamGEN	1%	1%	0%
Rewards (BNB)	2%	2%	1%
TOTAL	7%	10%	2%

Every 200 days, the Tax Council (community + core team) will open a vote on redistribution structure. Reports will be published quarterly.

IV. Auto-Burn Manual by Principle

While the tax includes a 1% burn on all activity types, Auto-Burn is not force-enabled. Burns may be manually triggered only by the authorized multisender, ensuring that:

Burn events are trackable LP supply is not silently reduced Holders see when and how deflation happens The contract supports manual burning tools only.

V. Liquidity Injection Smart & Modular

lvl. SBA Standards becomes real.

Every taxed Buy (1%) and Sell (4%) transaction fuels the engine of decentralized liquidity. Collected GENc tokens are not left idle.

They accumulate until the contracts swap threshold set initially at 0.5% of total supply

(owner-adjustable) is reached.

At that point, the protocol acts:

GENc is swapped for BNB BNB is auto-injected into the GEN/BNB liquidity pair 100% of LP tokens are burned (Until the AssetManager module goes live once it does, LP will be managed autonomously, locked, and verifiable)

No wallet custody. No centralized intervention. Just smart logic doing what it's designed to do stabilize, scale, and secure.

This is not just liquidity injection. This is SBA Standard in action.

The modularity ensures:

- Zero manual swaps
- No rug risk ever
- Full compatibility with future SBA mechanics

As the GENESIS ecosystem expands, this system enables adaptive liquidity control, giving the protocol freedom to grow without putting its token or holders at risk. Liquidity isnt a tool. Its a statement of intent. And here, its absolute.

VI. DMC Dynamic Management Console

Post-Pre-Sale, the DMC logic is activated, controlling: Max Transaction Amounts Max Wallet Holdings Live adjustment of swap threshold Exclusion lists for wallets (bot-controlled)

Initial values:

- → Max Hold per Wallet: 10,000,000,000 GENc (10B)
- → Max Sell per Tx: 1,000,000,000 GENc (1B)
- → Max Buy per Tx: 5,000,000,000 GENc (5B)

Over 350 days, maxSell increases in ~9 steps to reach parity with maxHold

VII. Recovery & Precision

The contract contains a verified recovery function allowing retrieval of tokens mistakenly sent to the GEN contract.

Also includes:

manualSwap() logic for gas optimization

multisend() with access control Gas-efficient batch handling for bot compatibility

VIII. Rewards System GENc & BNB Based

GENcoin holders benefit from a dual-layered rewards structure.

GENc dividend logic is handled autonomously, described in detail in the official Distribution Mechanics section.

BNB-based dividend distribution is similarly secured and detailed in a separate dividend document.

Both systems are on-chain, auditable, and modular but fall outside this core protocol description.

Their full technical breakdown is covered in the designated rewards architecture segment.

IX. Future Governance Built to Evolve, Not Decay

GEN isnt static. Its modular by purpose:

Tax system: community voting every 200 days

LP logic: adjustable threshold and swap ratios

DMC settings: bot-controlled after Pre-Sale

Upcoming modules: AssetManager, GovernanceBot, VaultLink Governance

isnt optional its embedded.

”SBA will interlink systems and activate users through smart logic, not permission.

Votes are earned. Evolution is coded.

GEN is not just decentralized its the protocol of progressive autonomy.”

X. Final Insight GENESIS is the Strategic Beginning

GENESIScoin wasnt launched to follow hype. It was architected to become the financial spine of something greater:

The SBA Formation.

► Every tax.

► Every allocation.

► Every delay.

► Every off-chain tool.

► Every single constraint.

was never accidental. Its not a stunt. Its a structure

GENcoin is the first Element.

The first certifiably secure unit.

A launchpad not a finish line.

This is not just a token.

This is the engine of change.

We dont ask for permission.

We deploy systems that cannot be ignored.

The First Chapter of GEN:

Born.

Evolved.

Secured.

Built to Fuse
